Internet Purchase / Fannie's Flowers

I surfed the net with my desktop computer and went to *Fannie's Flowers* to get something for a friend's birthday. I made my selections and went to checkout. I selected NC3 where I was presented with this simple checkout screen. I scanned the QR-m.

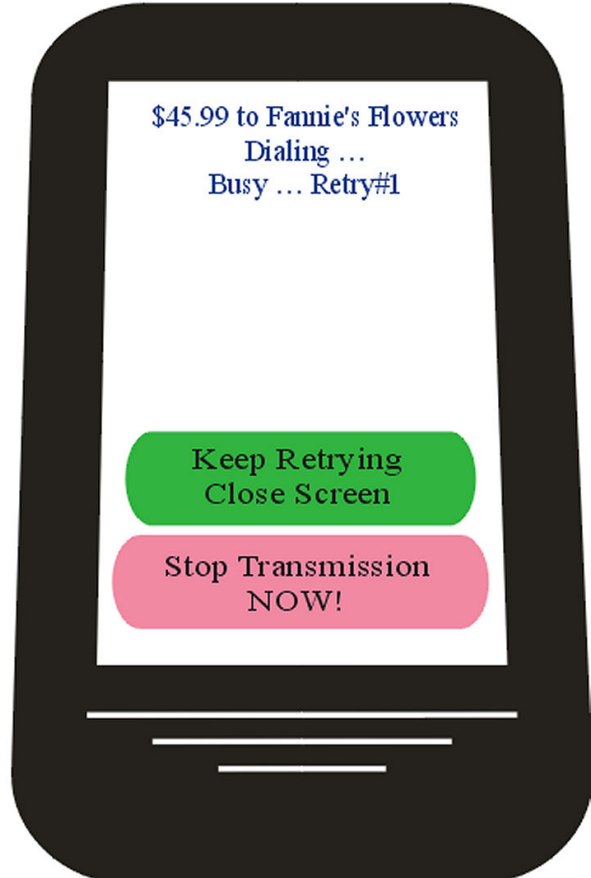

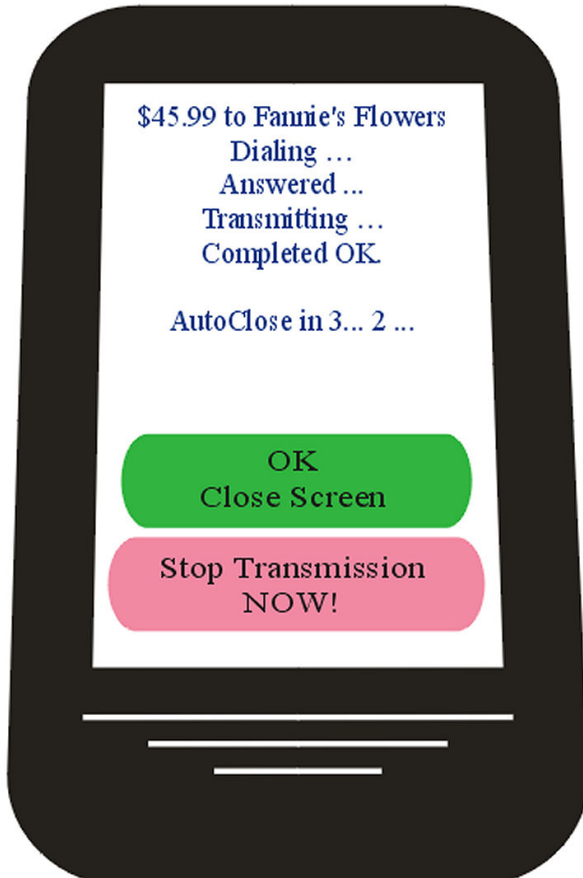

(There are ways of using the phone's browser and NC3 for secure mobile commerce.)

My device required approval of what it read from the QR-m.

My email address was already entered into my NC3 application and I click "Yes to all"

My device starts to transmit and shows me the progress. I could have closed the screen.

Transmission complete, the screen automatically closes.

I go back to the desktop computer and click where it asks me to.

The screen changes to show Fannie's searching for my payment.

If there is a delay, or I don't want to bother to wait the few seconds I could have clicked on the button shown.

The payment is found, matched and we're all done.

I click on the top button to close the order and return to the home page of Fannie's Flowers.
